

PROPEX Scourlok

PROPEX® Scourlok® is an Engineered Bank Stabilization system designed to resist extreme hydraulic stresses and protect shorelines. Scourlok is ideal for applications that need below water scour protection in addition to slope stabilization and erosion control. Scourlok is constructed of rigid cells armored with Pyramat® 75 High Performance Turf Reinforcement Mat (HPTRM) and internally lined with MIRAFI® nonwoven geotextile. Pyramat is fastened to the rigid cells to provide a flexible exterior, control erosion, and improve system durability and forms pockets that can be filled with mulch or other media to promote and sustain vegetation. The durable geotextile lining allows the rigid cell to be filled with earth, sand, gravel, crushed rock, and other granular material.

Scourlok provides permanent erosion protection from time of initial construction. Scourlok has superior strength and durability to withstand the most demanding environments. Scourlok conforms to the property values listed below¹ and is manufactured at a Solmax facility with ISO 9001:2015 and ISO 14001:2015 certifications. Solmax performs internal Manufacturing Quality Control (MQC) tests that have been accredited by the Geosynthetic Accreditation Institute – Laboratory Accreditation Program (GAI-LAP).

NOTES:

- ⁽¹⁾ The property values listed above are effective 05/01/2023 and are subject to change without notice. Values represent testing at time of manufacture.
- ⁽²⁾ Minimum average roll values (MARV) are calculated as the typical minus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any samples taken from quality assurance testing will exceed the value reported.
- ⁽³⁾ Maximum Average Roll Value (MaxARV), calculated as the typical plus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any sample taken during quality assurance testing will meet to the value reported.
- ⁽⁴⁾ Typical average values shown.

⁽¹⁾ The property values listed above are effective 05/01/2023 and are subject to change without notice. Values represent testing at time of manufacture.

⁽²⁾ Minimum average roll values (MARV) are calculated as the typical minus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any samples taken from quality assurance testing will exceed the value reported.

⁽³⁾ Maximum Average Roll Value (MaxARV), calculated as the typical plus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any sample taken during quality assurance testing will meet to the value reported.

⁽⁴⁾ Typical average values shown.

⁽⁵⁾ Maximum permissible velocity and shear stress has been obtained through vegetated testing programs featuring specific soil types, vegetation classes, flow conditions, and failure criteria. These conditions may not be relevant to every project nor are they replicated by other manufacturers. Please contact Solmax for further information.

⁽⁶⁾ Calculated as typical values from large-scale flexible channel lining test programs with a flow depth of 6 to 12 inches.
